

Check Your Understanding 3.1

Name: _____ Period: _____ Date: _____

Complete each problem. Write CPCTC in full before using it. Show all work.

Basic	Intermediate	Advanced
Constructions and What They Prove → Proof begins with what we can construct from axioms		
<i>Basic</i> 1. Describe the steps of Euclid's Proposition 1 (constructing an equilateral triangle on a given segment AB). You may use words, a diagram, or both. You do not need to prove it — just describe the construction.	<i>Intermediate</i> 2. For each step of the equilateral triangle construction, state the postulate or common notion that justifies it. (a) <i>Drawing the two circles centered at A and B.</i> (b) <i>Naming the intersection point C.</i> (c) <i>Connecting A, B, C to form the triangle.</i> (d) <i>Concluding $AC = BC = AB$.</i>	<i>Advanced</i> 3. A student says: 'I drew an equilateral triangle freehand and measured all three sides with a ruler. They were all 4 cm. I have proven it is equilateral.' (a) <i>Explain specifically what is wrong with this argument.</i> (b) <i>Explain why Euclid's compass-and-straightedge construction does prove the result, while the measurement does not.</i> (c) <i>What postulate makes the construction argument work? Cite it by number.</i>
Algebra Spiral <i>Simplify</i>	<i>Algebra Spiral</i> Simplify each expression completely. (a) $3x^2 - 5x + 2x^2 + 7x$ (b) $4(2a - 3) - 2(a + 5)$ (c) $(5y^3 - 2y + 1) - (3y^3 + y - 4)$	

CYU 3.1 — Answer Key (Teacher Copy)**Constructions and What They Prove**

- 1.** Draw segment AB. Draw circle centered at A with radius AB. Draw circle centered at B with radius AB. Name one intersection point C. Connect AC, BC. Accept any accurate description.
- 2a.** Postulate 3 — a circle can be drawn with any center and radius.
- 2b.** The two circles must intersect (this follows from the construction; Euclid assumes it implicitly — a gap modern geometers flag).
- 2c.** Postulate 1 — a straight line can be drawn between any two points.
- 2d.** Common Notion 1 — things equal to the same thing are equal to each other. $AC = AB$ (both radii of circle centered at A); $BC = AB$ (both radii of circle centered at B); therefore $AC = BC = AB$.
- 3a.** Measurement with a ruler introduces human error and depends on instrument precision. The student has shown the sides appear equal on one occasion, not that they must be equal.
- 3b.** The construction works because it operates within the axiomatic system. Every step follows from a postulate or common notion. The conclusion is forced by logic, not by measurement.
- 3c.** Postulate 3 (circles) and Common Notion 1 (transitivity of equality). Both are required.

Algebra Spiral

- (a)** $5x^2 + 2x$
- (b)** $6a - 22$
- (c)** $2y^3 - 3y + 5$
